

CommandFusion guiDesigner Release Notes

Current Version: 2.1.1.0
Released: 8th October 2009.

Version: 2.1.1.0
Released: 8 October 2009

Changes:

- Added 'Export project archive' option to create a zip file of a project, with all images used.
- Added 'WOL Generator' tool for creating the magic packet required for 'Wake On Lan'.
- Added 'Project Properties' in main edit menu.
- Fixed bug where overlay browser would not update when changing the overlay set selected.
- Fixed bug where system startup command drop box would fill incorrectly when editing a system.

Known Issues

- Helvetica font sets don't show in the font selection dialogs.
- System Creator not yet functional.

Version: 2.1.0.1
Released: 11 September 2009

Changes:

- Changed Online Update dialog to also show current version info.
- Fixed 'Update Library' button on the 'New System Wizard' dialog.
- Disabled the 'System Creator' within the System Library – not quite ready for release yet. Maybe next version.

Version: 2.1.0.0
Released: 10 September 2009

Changes:

- Renamed 'Command Manager' to 'System Manager' as you can now do more than manage commands with that part of guiDesigner.
- Added wizards for creating new systems, commands and feedback parsing.
- Added Regex Tester for a quick and easy way to test your regex configurations for feedback parsing.
- Changed the way systems, commands and feedback parsing are edited – instead of using property lists, each has its own dedicated editing form.

CommandFusion guiDesigner Release Notes

- Changed the way commands and systems are created. Systems are now added individually, and commands can then be added to existing systems in a separate process. Added export screenshots function to the File menu. This allows you to create screenshot files for each page in the current project with a single click.
- Added menu commands for clearing all commands and macros from the current page and all pages in the current project.
- Added ability to make button overlay images have negative X and Y offsets for more precise placement.
- Added ability to toggle “simulate feedback” mode for buttons when multiple buttons are selected.
- Fixed issue with macro delays not saving correctly at times.
- Fixed issue with transparent input field themes not saving correctly.
- Fixed issue with adding multiple systems to the System Manager.
- Fixed issue with new macros not always showing in the System Manager.

Version: 2.0.1.1

Released: Unreleased (public beta)

Changes:

- Added option to save project before starting upload service if project not saved.
- Fixed issue with themes not saving correctly
- Fixed issue where new projects would fail to save

Version: 2.0.1.0

Released: Unreleased (public beta)

Changes:

- Added ability to enable hiding of window contents for page editing while dragging to improve UI responsiveness.
- Drastically improved the overall memory usage and speed.
- Added save and save as buttons to toolbar.
- Added distribute vertically and horizontally buttons to toolbar.
- Fixed international language issues with loading/saving gui files. Please let us know if anyone still experiences problems when using languages other than English under ‘standards & formats’ in regional settings of windows control panel.
- Added ability to press enter key to confirm custom join click assign.
- Added click assign for input field objects.
- Fixed bug where command/macro repeats delay on buttons wasn’t being saved.
- Fixed bug where deleting a command that is part of a macro failed.
- Fixed crash when registering .gui file type failed due to no administrator access.
- Fixed bug where list tester would stay visible if list was deleted.
- Fixed bug with slider properties form for inactive indicator adjustments.
- Fixed bug where sliders would not draw correctly under certain circumstances.
- Fixed bug with text properties not redrawing on window resize.
- Fixed bug with enter key not closing button and text property dialogs.

CommandFusion guiDesigner Release Notes

- Fixed bug where 'check for update on launch' menu item would show incorrect state.
- Fixed bug where update check could be run more than once at a time.
- Fixed bug with input field themes not recognizing transparent bg color on load.
- Fixed bug with System Library not loading UDP ports definitions correctly.
- Fixed some button 'sync states' properties not syncing correctly.
- Changed button property form layout to reflect URL text being state independant.
- Fixed slow list drawing issues.
- Fixed bug where null values could be assigned to objects using click assign custom join option.
- Fixed default ENTER and ESC key actions on theme picker window.

Version: 2.0.0.0

Released: 2 Feb 2009

Known Issues:

- PC must be using English language and locale settings. Other language options may cause issues due to number formatting.
- Toolbar buttons for 'even GUI object distribution' coming in next release.

Changes:

- Added docking for all manager windows, including reset layout and layout persistence options.
- Added online update checker, optional check on startup.
- Added F12 command to start Upload Service.
- Added activity LED for upload service activity.
- Added List GUI object tools.
- Added Command Manager for managing commands and macros.
- Added ability to assign custom commands/macros to buttons via button properties form and also by dragging/dropping a command from the command manager onto a button in an open page.
- Added online update feature to download pre-configured command/macro libraries for third party devices. GlobalCache libraries available at time of release.
- Added 'Click Assign Overlay Image Properties' tool to quickly adjust button overlay image positions.
- Added ability to 'Match Theme Image Size' with multiple objects selected.
- Added ability to type join numbers using join click assign tools in Custom Join mode.
- Added Sound Manager.
- Added keyboard shortcuts to show/hide joins and command/macro names.
- Separated Manage Devices and Upload Project functions.
- Device ID now reported to Upload Service form rather than Manage Devices form.
- Changed colors for join previews when editing pages.
- GUI Object property editor window can now be resized to allow previewing of larger GUI objects in real time.
- Increased stability in large projects by changing undo scheme.

CommandFusion guiDesigner Release Notes

- Undo is now separated for project properties/theme properties and page changes.
- Changed 'image folder' project property to 'asset folder' to cater for images and sounds.
- Save As now copies all project assets to the destination folder if required.
- Changed method of retrieving local IP address for upload service.
- Added ability to export and import device licenses to/from *.cfl (CommandFusion License) files.
- Added "Clickthrough" mode for images and subpages
- Added "Toggle" mode for simulated button presses
- Fixed issues with subpages with transparent background themes rendering incorrectly.
- Fixed issues with project tree refreshes when adding/editing page and subpage nodes.
- Fixed many minor issues.

Version: 1.0.1

Released: 20 Aug 2008

Known Issues:

- PC must be using English language and locale settings. Other language options may cause issues due to number formatting.

Changes:

- Fixed issue with subpage references not rendering correctly when subpage was assigned a background theme.
- Added warning message when editing themes that use fonts not installed on current PC.
- Fixed deleting of multiple selected objects via right click menu.
- Fixed deleting of sliders via right click menu.
- Fixed images drawing incorrect size due to DPI other than 72.

Version: 1.0

Released: 13 Aug 2008

- Initial release
